

Reducing cold stress whitening

Abstract

- 5 Undesirable changes in shade brought about by low temperatures (Cold Stress
Whitening) in impact-modified thermoplastic molding compositions F which comprise at
least one elastomeric graft polymer A and at least one thermoplastic polymer B are
reduced by adding from 10 to 200 ppm, based on the molding compositions F, of at
least one polyorganosiloxane S to the impact-modified thermoplastic molding
10 composition F.
